

Solar Eco Fluid Recover Container

Capacity: 9.5 Ltrs

Dimension: 300mm wide x 270mm high

Total clearance required: 440mm high

Container comes complete with drain valve.

When a solar safety valve actuates, a solar glycol fluid is expelled from the system with all of the inherent problems that can bring, including the possibility of contamination.

With the addition of this storage container, the fluid can be channelled direct from the safety valve into a securer container allowing its recovering during regular maintenance – neatly avoiding the issues of potential damage to those areas surrounding the valve.
